

Figure 8-2 Summary plot of simulation results

The incidence on the 60th day, plotted geographically on a colored logarithmic scale. Plots across go from unrestricted travel over 50 km-restricted to 20 km-restricted. Plots down go from the maximum value of λ to the minimum. The total incidence on the left-most middle row was 77 000, compared to only 15 000 on the right. The arcs/circles represent the mean reach from the epicenter.
