Patients’ needs regarding chronic pain rehabilitation and management

AKADEMISK AVHANDLING
som för avläggande av medicine doktorsexamen vid Karolinska Institutet offentligen försvaras i Föreläsningssal 1 på Institutionen för kliniska vetenskaper, Danderyds Sjukhus AB

Fredagen den 10 december, 2010, kl 10.00

av
Åsa Skjutar
Doktorand, Leg. arbetsterapeut

Huvudhandledare:
Docent Maria Müllersdorf
Mälardalens högskola
Akademin för hälsa, vård och välfärd

Bihandledare:
PhD Marie-Louise Schult
Karolinska Institutet
Institutionen för kliniska vetenskaper,
Danderyds sjukhus
Enheten för rehabiliteringsmedicin

Professor Kyllike Christensson
Karolinska Institutet
Institutionen för kvinnors och barns hälsa
Enheten för reproduktiv och perinatal omvårdnad

Stockholm 2010

FakultetsoppONENT:
Professor Birgitta Bernspång
Umeå universitet
Institutionen för samhällsmedicin och rehabilitering

Betygsnämnd:
Professor Björn Gerdle
Hälsouniversitetet i Linköping
Institutionen för klinisk och experimentell medicin
Avdelningen för rehabiliteringsmedicin

Docent Ann Öhman
Umeå universitet
Institutionen för folkhälsa och klinisk medicin

Adjungerad Professor Jan Lexell
Lunds universitet
Institutionen för kliniska vetenskaper
Avdelningen för rehabiliteringsmedicin
ABSTRACT

The overall aim of this thesis is to explore and describe patients’ needs related to chronic pain rehabilitation and management from the perspectives of health care professionals and patients with chronic pain.

Study I explores indicators of need for referral to pain rehabilitation using a Delphi study with a multidisciplinary expert panel (n=23). The results show a multifaceted view of indicators, including aspects of physical and mental health, coping strategies, and work environment. Intuitive impressions of patients’ overall clinical presentations and patients’ ages are brought forward as indicators.

Study II explores specific needs for occupational therapy using focus group discussions (n=6) with occupational therapists (n=25). Limitations of occupational performance is the theme found. Explicitly, 13 indicators for occupational therapy are found; these include aspects of patients’ behaviors, level of knowledge, level of occupational balance, mental health, and the physical or environmental strains that are present in the patients’ living contexts.

In Study III, outcomes of an intervention, ‘Balance in Everyday Life’, are described and explored in terms of occupational performance and satisfaction using a single-case design (n=5). Results demonstrate that four out of five patients had improved their occupational performance (+0.1-2.3), two of which were of clinical significance. Also, five out of five patients had improved their occupational satisfaction (+0.1-5.3), and two were of clinical significance. Measures changed jointly and independently.

Study IV describes needs related to pain management of participants with chronic pain; they were portrayed in stories of daily life using individual interviews (n=10). Results describe how participants need to protect themselves from themselves and need to balance their eager mind and their painful body’s need to rest. Participants also need to transform their self-image and to discover new behaviors, routines, and perspectives. The need for affirmation through communion and enjoyment of valued occupations is also highlighted as a prerequisite for successful pain management.

Indicators that either pain rehabilitation or occupational therapy is needed involved dysfunctional behaviors of the patient with chronic pain, demographics (e.g., age), as well as tacit knowledge of health care professionals. The occupational needs of participants living with chronic pain could to some extent be met by the intervention received. Engaging in valued occupations and adopting an altered perspective of one’s priorities and occupational performance are highlighted as important for successful pain management.

Key words: activities of daily living, chronic pain, content analysis, Delphi, focus groups, needs, needs assessment, occupational therapy, pain management, pain rehabilitation, single-case design.
