Institutionen för neurobiologi vårdvetenskap och samhälle

Gestational age at birth and risk of esophageal inflammation and cancer

AKADEMISK AVHANDLING
som för avläggande av medicine doktorsexamen vid Karolinska Institutet offentligen försvaras i Sal 215, Cefam, Alfred Nobels Allé 12, Flemingsberg.

Fredagen den 15 februari 2013, kl 09.00

av
Lina Forssell
Leg läkare

Huvudhandledare:
Docent Olof Akre
Karolinska Institutet
Institutionen för Medicin, Solna
Enheten för klinisk epidemiologi

Fakultetsopponent:
Prof. Jørn Olsen
Aarhus Universitet
Department of Public health
Institute of epidemiology and social sciences

Bihandledare:
Prof. Matteo Bottai
Karolinska Institutet
Institutionen för Miljömedicin
Enheten för biostatistik

Betygsnämnd:
Docent Jan Johansson
Lunds Universitet
Institutionen för kliniska vetenskaper

Prof. Jesper Lagergren
Karolinska Institutet

Enheten för övre gastrointestinal forskning

Docent Helle Kieler
Karolinska Institutet
Institutionen för Medicin, Solna
Enheten för klinisk epidemiologi

Prof. Lars Agréus
Karolinska Institutet
Institutionen NVS
Centrum för Allmänmedicin

Docent Lars Stenhammar
Linköpings Universitet
Institutionen för klinisk och experimentell medicin
ABSTRACT

Background In a hypothesis generating study by my colleagues a 7-fold increase in the risk of esophageal adenocarcinoma (EAC) was found in a cohort of individuals born preterm or with a low birth weight. Preterm born individuals regurgitate more than term born infants, and infant gastroesophageal reflux disease (GERD) might continue into childhood and even adulthood. GERD, a major public health problem in adult westernized populations, is a risk factor for esophagitis, Barrett’s esophagus (BE), and EAC. There are no previous studies assessing risk of inflammation, metaplasia, and cancer among adults in relation to perinatal characteristics.

Aims This thesis aims to explore the effect of gestational age and size at birth, on the risk of being diagnosed with esophagitis, BE or EAC later in life.

Patients and Methods We performed four population-based case-control studies. As cases we identified patients with endoscopy verified esophagitis, BE of intestinal metaplasia type, and EAC from the Swedish Cancer Register, the Patient Register and from two local Barrett Registers. Control individuals were randomly selected from the source population, and matched on age, sex and location of birth. We collected exposure data from birth records, including the variables gestational age, birth weight and length, and maternal diseases, among others. Using conditional logistic regression we modeled the risk of being a case based on exposure status, and calculated odds ratios (OR) and 95% confidence intervals (CI). A p value of 0.05 was considered statistically significant.

Results Compared to birth at term with adequate birth weight for gestational age, preterm birth and being SGA increased the risk of being diagnosed with esophagitis (OR 2.7, 95% CI 2.2-3.5 and OR 1.5, 95% CI 1.3-1.7, respectively), and even more so among those diagnosed before 10 years of age (OR 6.8, 95% CI 4.7-10.0 and OR 2.0, 95% CI 1.6-2.5, respectively). We found an increased risk of being diagnosed with BE among those born SGA and <3rd percentile (OR 3.0, 95% CI 1.4-6.4), as well as those in the 3rd to<10th percentile (OR 1.8, 95% CI 1.0-3.1). The risk of BE was also increased among those with a birth weight <2,500 grams (OR 8.2, 95% CI 2.8-23.9). The risk of EAC was increased by 13% per week preterm birth, compared to birth at term (OR 1.1, 95% CI 1.0-1.3). No effect of size at birth was seen for EAC, or for cardia adenocarcinoma and esophageal squamous cell carcinoma.

Conclusions Altogether, these data indicate that gestational age and size at birth are strongly associated with risk of esophagitis and BE later in life. Furthermore, the results indicate that preterm birth is associated with a risk of EAC and cardia adenocarcinoma, but not esophageal squamous cell carcinoma.
